

Scavenger Hunt

Parts of the flag were spread out across different places

We can locate them by first viewing the page source

There was a comment in the html source code that had the first part of the flag

There was a mycss.css file that had the second part of the flag

There was nothing in the js code, but there was a hint

How can I get Google to stop indexing my site?

We can view the robots.txt file on the website, which is used for setting rules for web crawlers

<https://developers.google.com/search/docs/crawling-indexing/robots/intro>

There is then a clue that the web site runs on an apache server

There is a similar file to robots.txt file that is available as a configuration file for an apache server

<https://httpd.apache.org/docs/2.4/howto/htaccess.html>

There is then another clue that the user build the website with a mac

https://en.wikipedia.org/wiki/.DS_Store

MACs store data in the .DS_Store file, this is where the last piece of the flag was found.
